How to install WSTrust Integration to Vibe and make it working together

System requirements

You must have installed and running

- WSTrust server part
- Portal Vibe OnPrem 3.1, 3.2 or 3.3

The portal Vibe OnPrem must be set to synchronize with the same tree (directory) to which is configured WSTrust.

Note – Once configured, it is recommended to enforce immediate synchronization with LDAP within VibeOnPrem (Administration> Configure LDAP> Run option immediately).

Installation

There is comfortable installation script available for installation on Linux platform. You must assign “run” permissions for installation script file `inst_wstrust_vibe_1.6.bin` (e.g., `chmod + x inst_wstrust_vibe_1.6.bin`) and run it (`./inst_wstrust_vibe_1.6.bin`). Script must be run on the server where the portal Vibe is installed

Then follow installation script instructions:

- Enter or confirm the path to the tomcat folder of Vibe OnPrem(default path is `/opt/novell/teaming/apache-tomcat`).
- Enter or confirm IP address and port where the server part of WSTrust is available (default address is `http://127.0.0.1:8485`).

Now the information about successful connection to the WSTrust server should be displayed. Then the installation is done and You have to restart Vibe OnPrem (typically by running `/etc/init.d/teaming restart`)
